

Newborn Baby Manikin

Echo Healthcare brings a new level of realism to medical training.

The **Newborn Baby (36 weeks +)** features lifelike fine details such as vasculature & underlying structures. Now with articulated limbs that can be positioned appropriately for your training objectives, you can take your training to the next level! Based on scans of real babies, features such as the ability to cannulate an umbilical cord, an ALS compatible airway and hand-punched real hair are available. Our manikins are available in a wide range of ethnicities and are created to an average weight and size. The realistic weight, skin, and look encourage natural handling that creates emotional attachment and engagement amongst learners.

KEY FEATURES

- Stepwise airway management with articulated mouth, upper airway, and lungs enabling bag-valve-mask (BVM), oropharyngeal airway, supraglottic airway and ET tube intubation
- Articulated limbs
- CPR compatible
